

# RPUG 2018 CONFERENCE - SOUTH DAKOTA

*30 Years On The Road To Progressively Better Data*

**Rapid City September 18-21**

## Where Does Safety Fit In Pavement Evaluation?

By

Jerry Daleiden, P.E.

ARRB Group Inc.

# “Forest for the Trees”

## Three Objectives:

1. Review challenges/pitfalls of traditional assessments
2. Share changes in technology  
(making more comprehensive assessments now possible)
3. Review potential implications

# History

Source: Virginia Tech Transportation Institute

- 1st International Skid Prevention Conference held in the USA, 1959
- American Society for Testing and Materials,  
ASTM committee E-17 on Skid Resistance, formed in 1960

# Traditional Safety Measurements

# Standard Safety Analysis Methods

Safety Performance Functions (SPF), relate crashes to several factors:

$X_1, X_2, \dots, X_n$

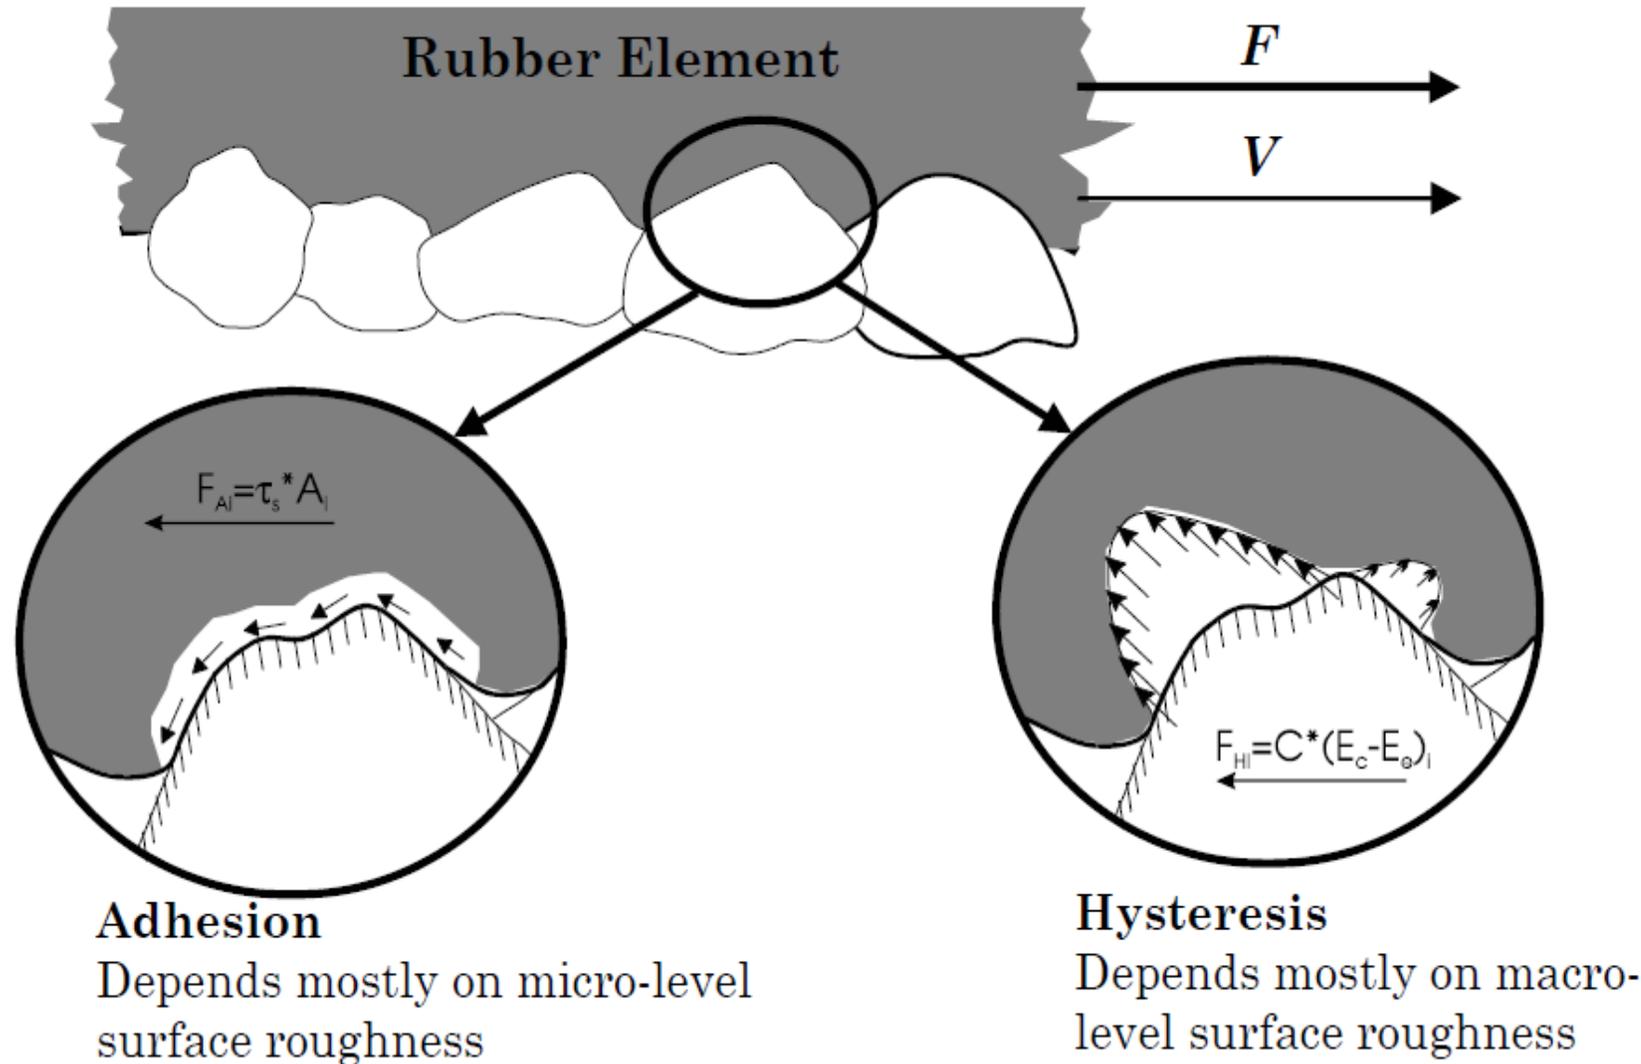

Explanatory variables

- ✓  $P$ : Number of crashes on segment  $L$
- ✓  $AADT$ : Traffic count
- ✓  $X_i$ : Friction, Texture, Curvature, cross-slope, grade, etc.

$$P = L \times e^{\beta_0 + \ln(AADT)\beta_1 + X_{1+i}\beta_{1+j}}$$

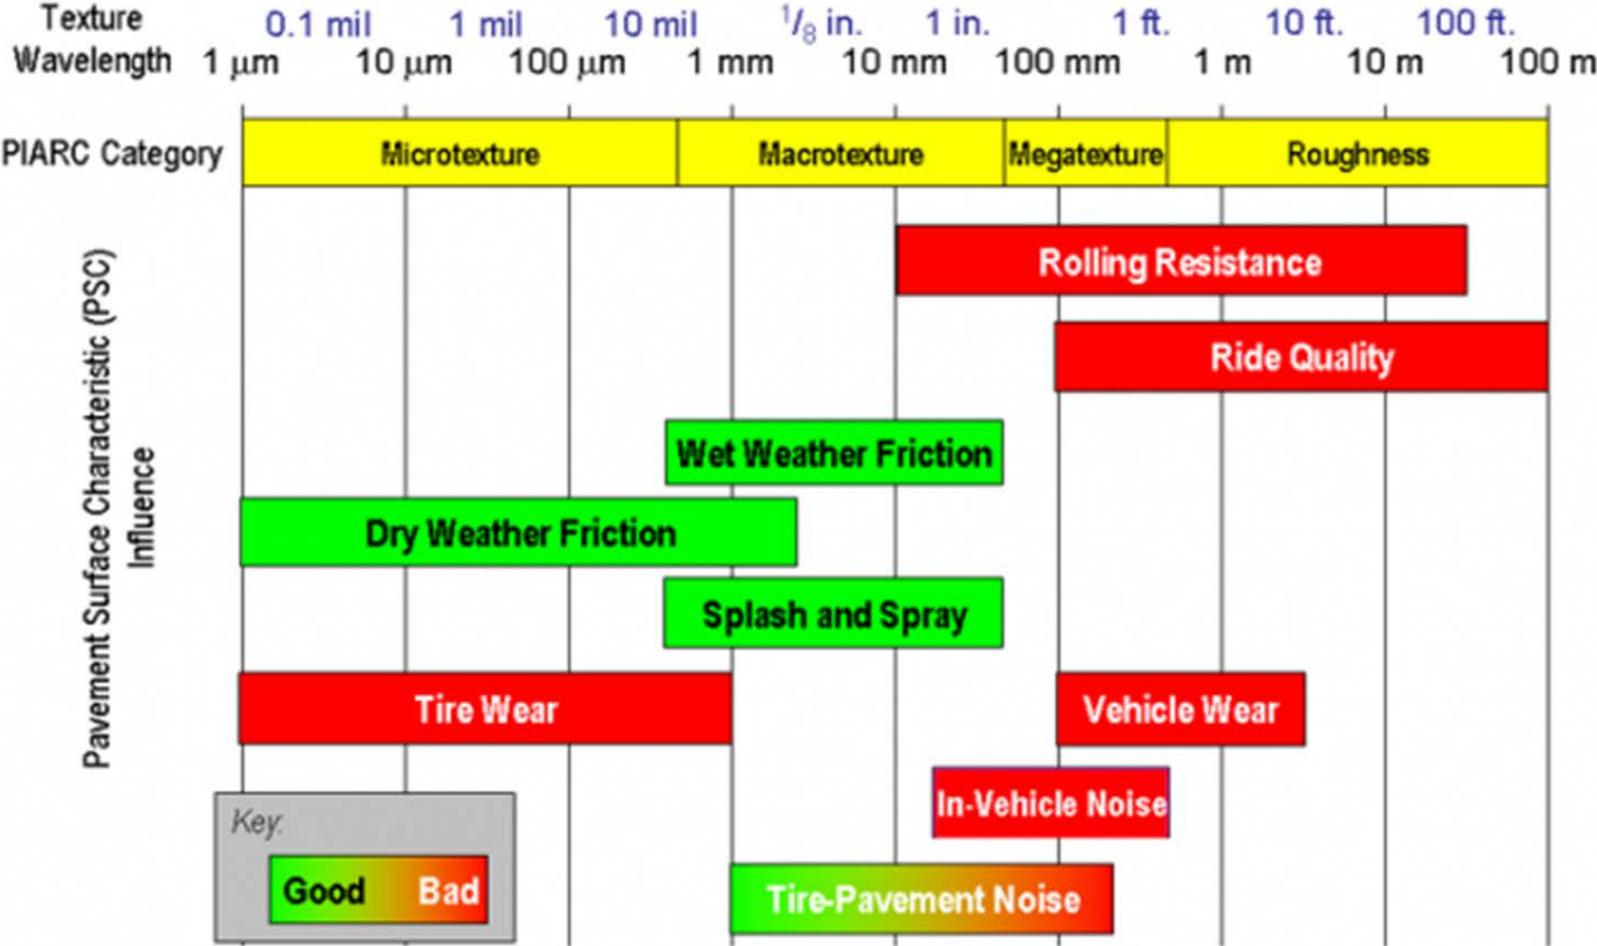

# Friction Assessment

Microtexture

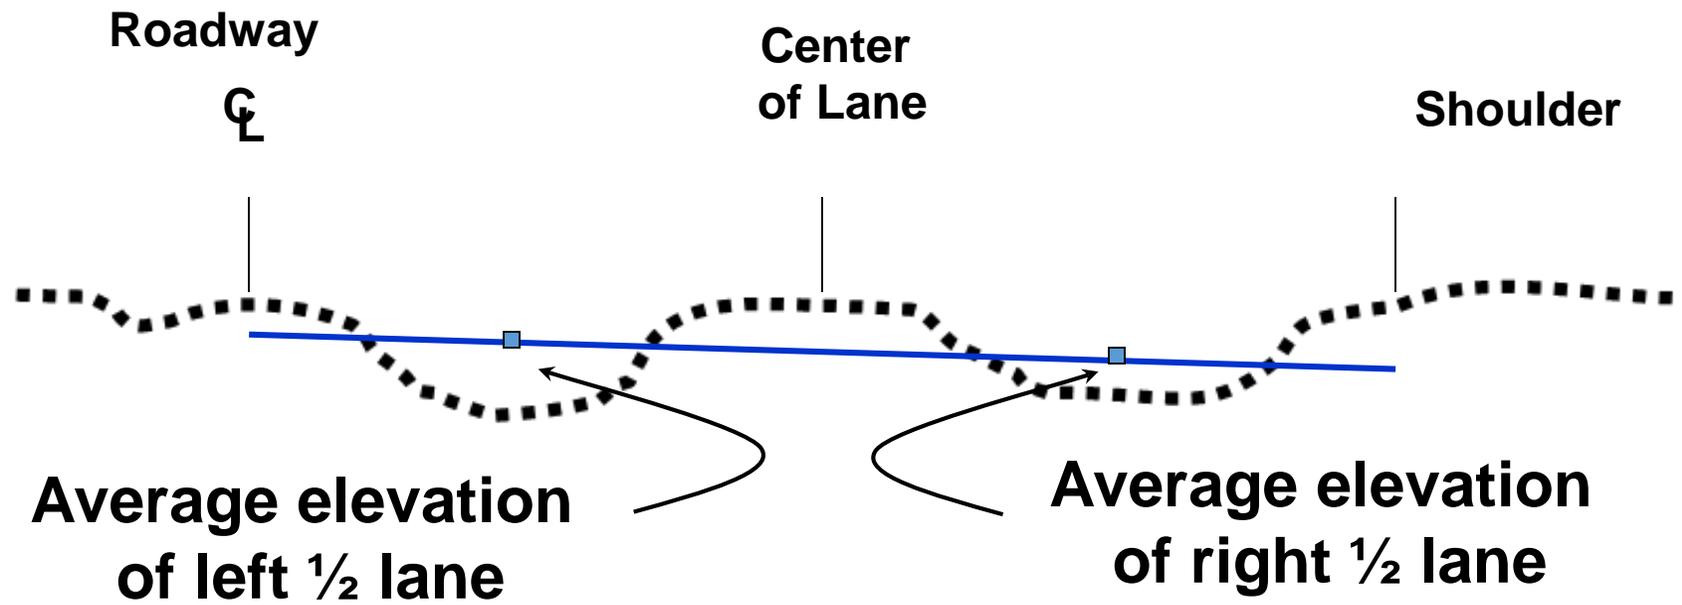

# Friction & Texture

Source: PIARC

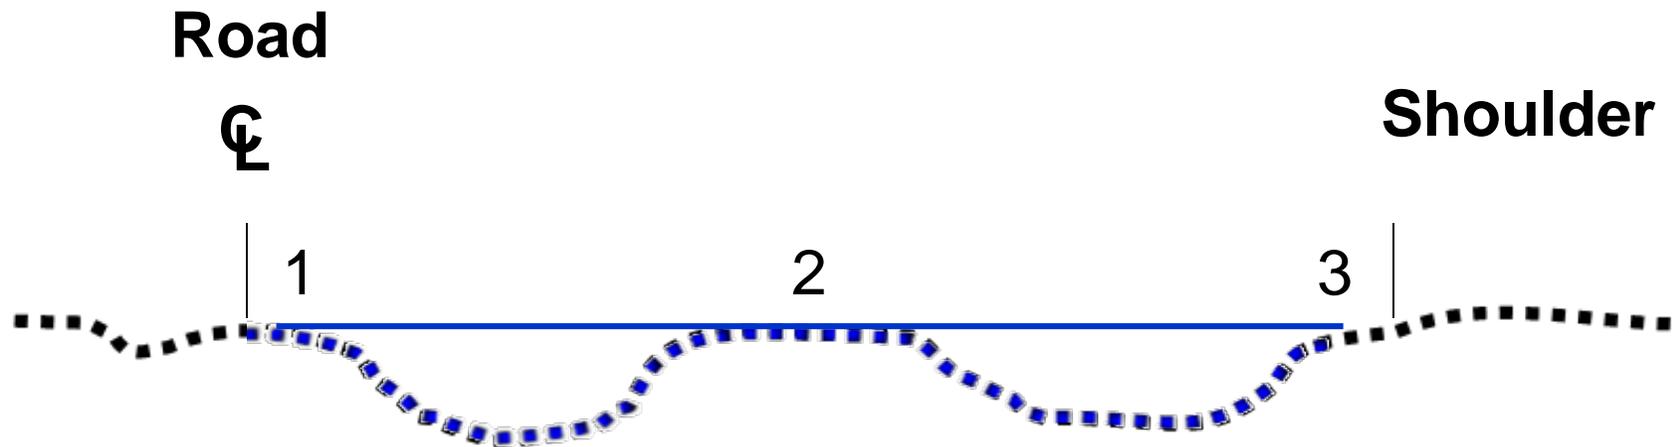

# Transverse Profile Analysis

## 1. Calculate Cross-slope

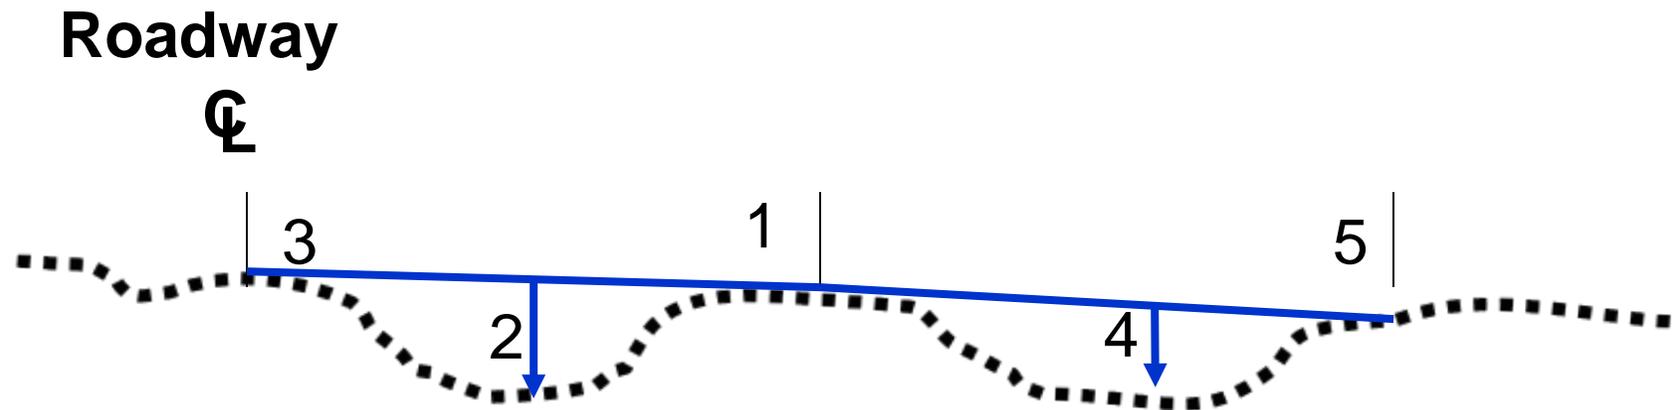

# Transverse Profile Analysis

## 2. Calculate Percent Deformation:

# Transverse Profile Analysis

## 3. Calculate Rut Depths

“Because the intensity of the polishing process increases markedly with tread element slip, all other factors being equal, the lowest friction levels are found on high-speed roads, curves, and approaches to intersections; in short, in locations at which high friction values are needed most.”

NCHRP Report 37, 1967

# Friction Demand – Investigatory Levels (UK)

| Site category and definition |   | Investigatory level (50 or 80 km/h) |      |      |      |      |      |      |      |
|------------------------------|---|-------------------------------------|------|------|------|------|------|------|------|
|                              |   | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| A                            | Motorway  | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| B                            | Dual carriageway non-event  | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| C                            | Single carriageway non-event  | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| Q                            | Approaches to and across minor and major junctions, approaches to roundabouts | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| K                            | Approaches to pedestrian crossings and other high risk situations             | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| R                            | Roundabout  | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| G1                           | Gradient 5-10% longer than 50m  | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| G2                           | Gradient >10% longer than 50m   | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| S1                           | Bend radius < 500m - dual carriageway   | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |
| S2                           | Bend radius < 500m - single carriageway                                       | 0.30                                | 0.35 | 0.40 | 0.45 | 0.50 | 0.55 | 0.60 | 0.65 |

# Continuous vs. Sampled

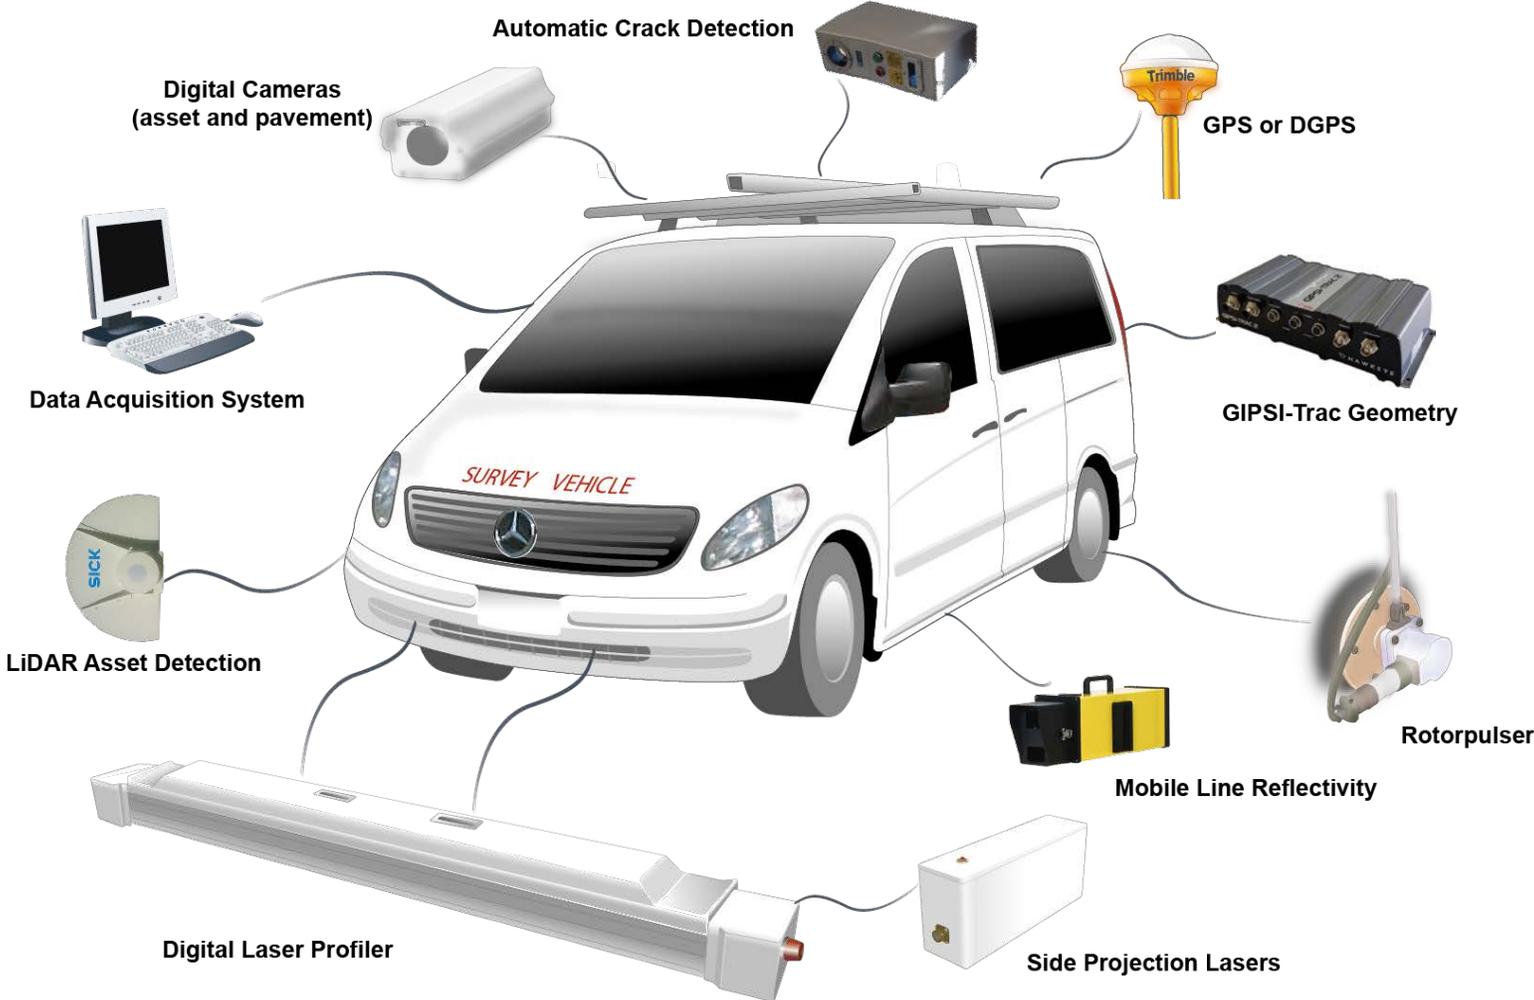

Standard friction testing in the USA is:

- "Sample" based
- Locked Wheel Skid Testing (LWST)

Pavement conditions however, vary along roadways

- Density (Intelligent Compaction, Infrared Technology, GPR)
- Structural Integrity (TSD, GPR)
- Segregation (Texture)
- Ride

# Road inspection technology

# Hawkeye 2000 system integration

- high resolution and calibrated images
- geo-referenced
- Gipsitrac (IMU)
  - For objective measure of horizontal curvature
- fully integrated outputs
- customised safety rating software
- collection of roughness, rutting and texture data

# Calibrated images

# Continuous Friction Measurement

- Continuous friction measurement
- 15 to 55 mph
- Typically 150 lane miles per day

# Continuous Friction Measurement

- Skewed tire (20°- 34% slip)
- Dynamic vertical load system
- Continuous tire pressure monitoring
- Dynamic speed controlled water system
- Ambient air temperature monitoring
- Tire temperature monitoring

Full compliance with BS 7941-1:2006.

# Continuous Friction Measurement

## Rubber Tire Slip

- measuring **micro**-texture continuously

## Laser based texture measurement system

- measuring **macro**-texture continuously

Both Wheel Paths Simultaneously

# Additional Assessment Capabilities

+ GNSS DGPS geospatial location

+ Digital imaging system

**Geometry** – Cross fall, Grade, Horizontal and Vertical curvature

+ Rutting over full lane width

+ Texture in Center and Both wheel paths

Continuous Friction Response

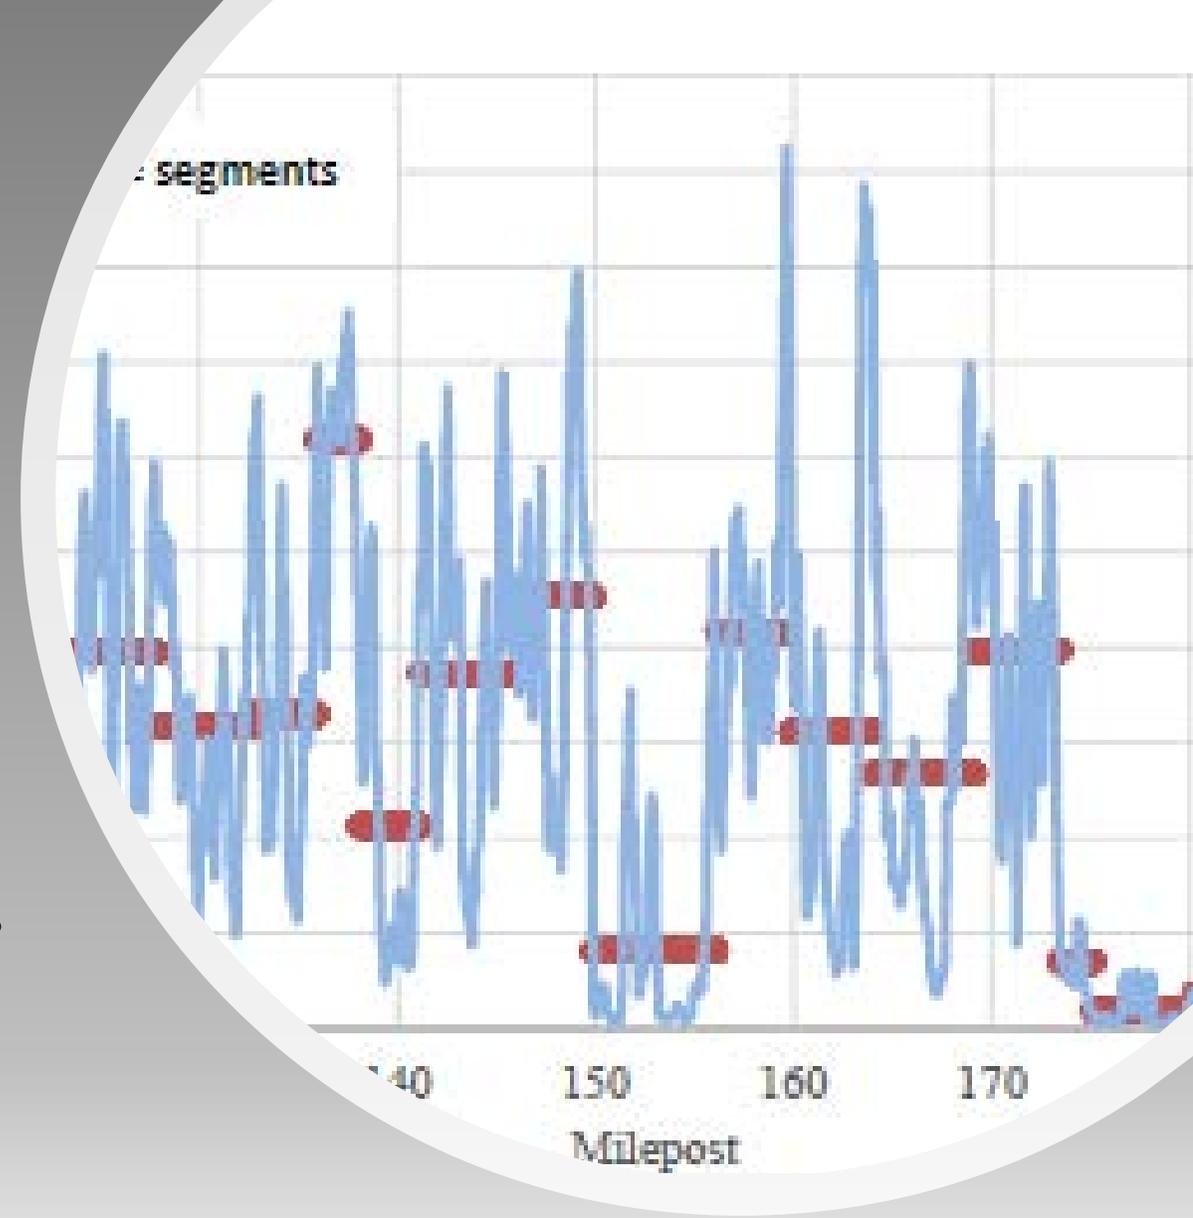

# Network level data, project level detail

## Pavement Conditions Vary

- Continuous properties needed

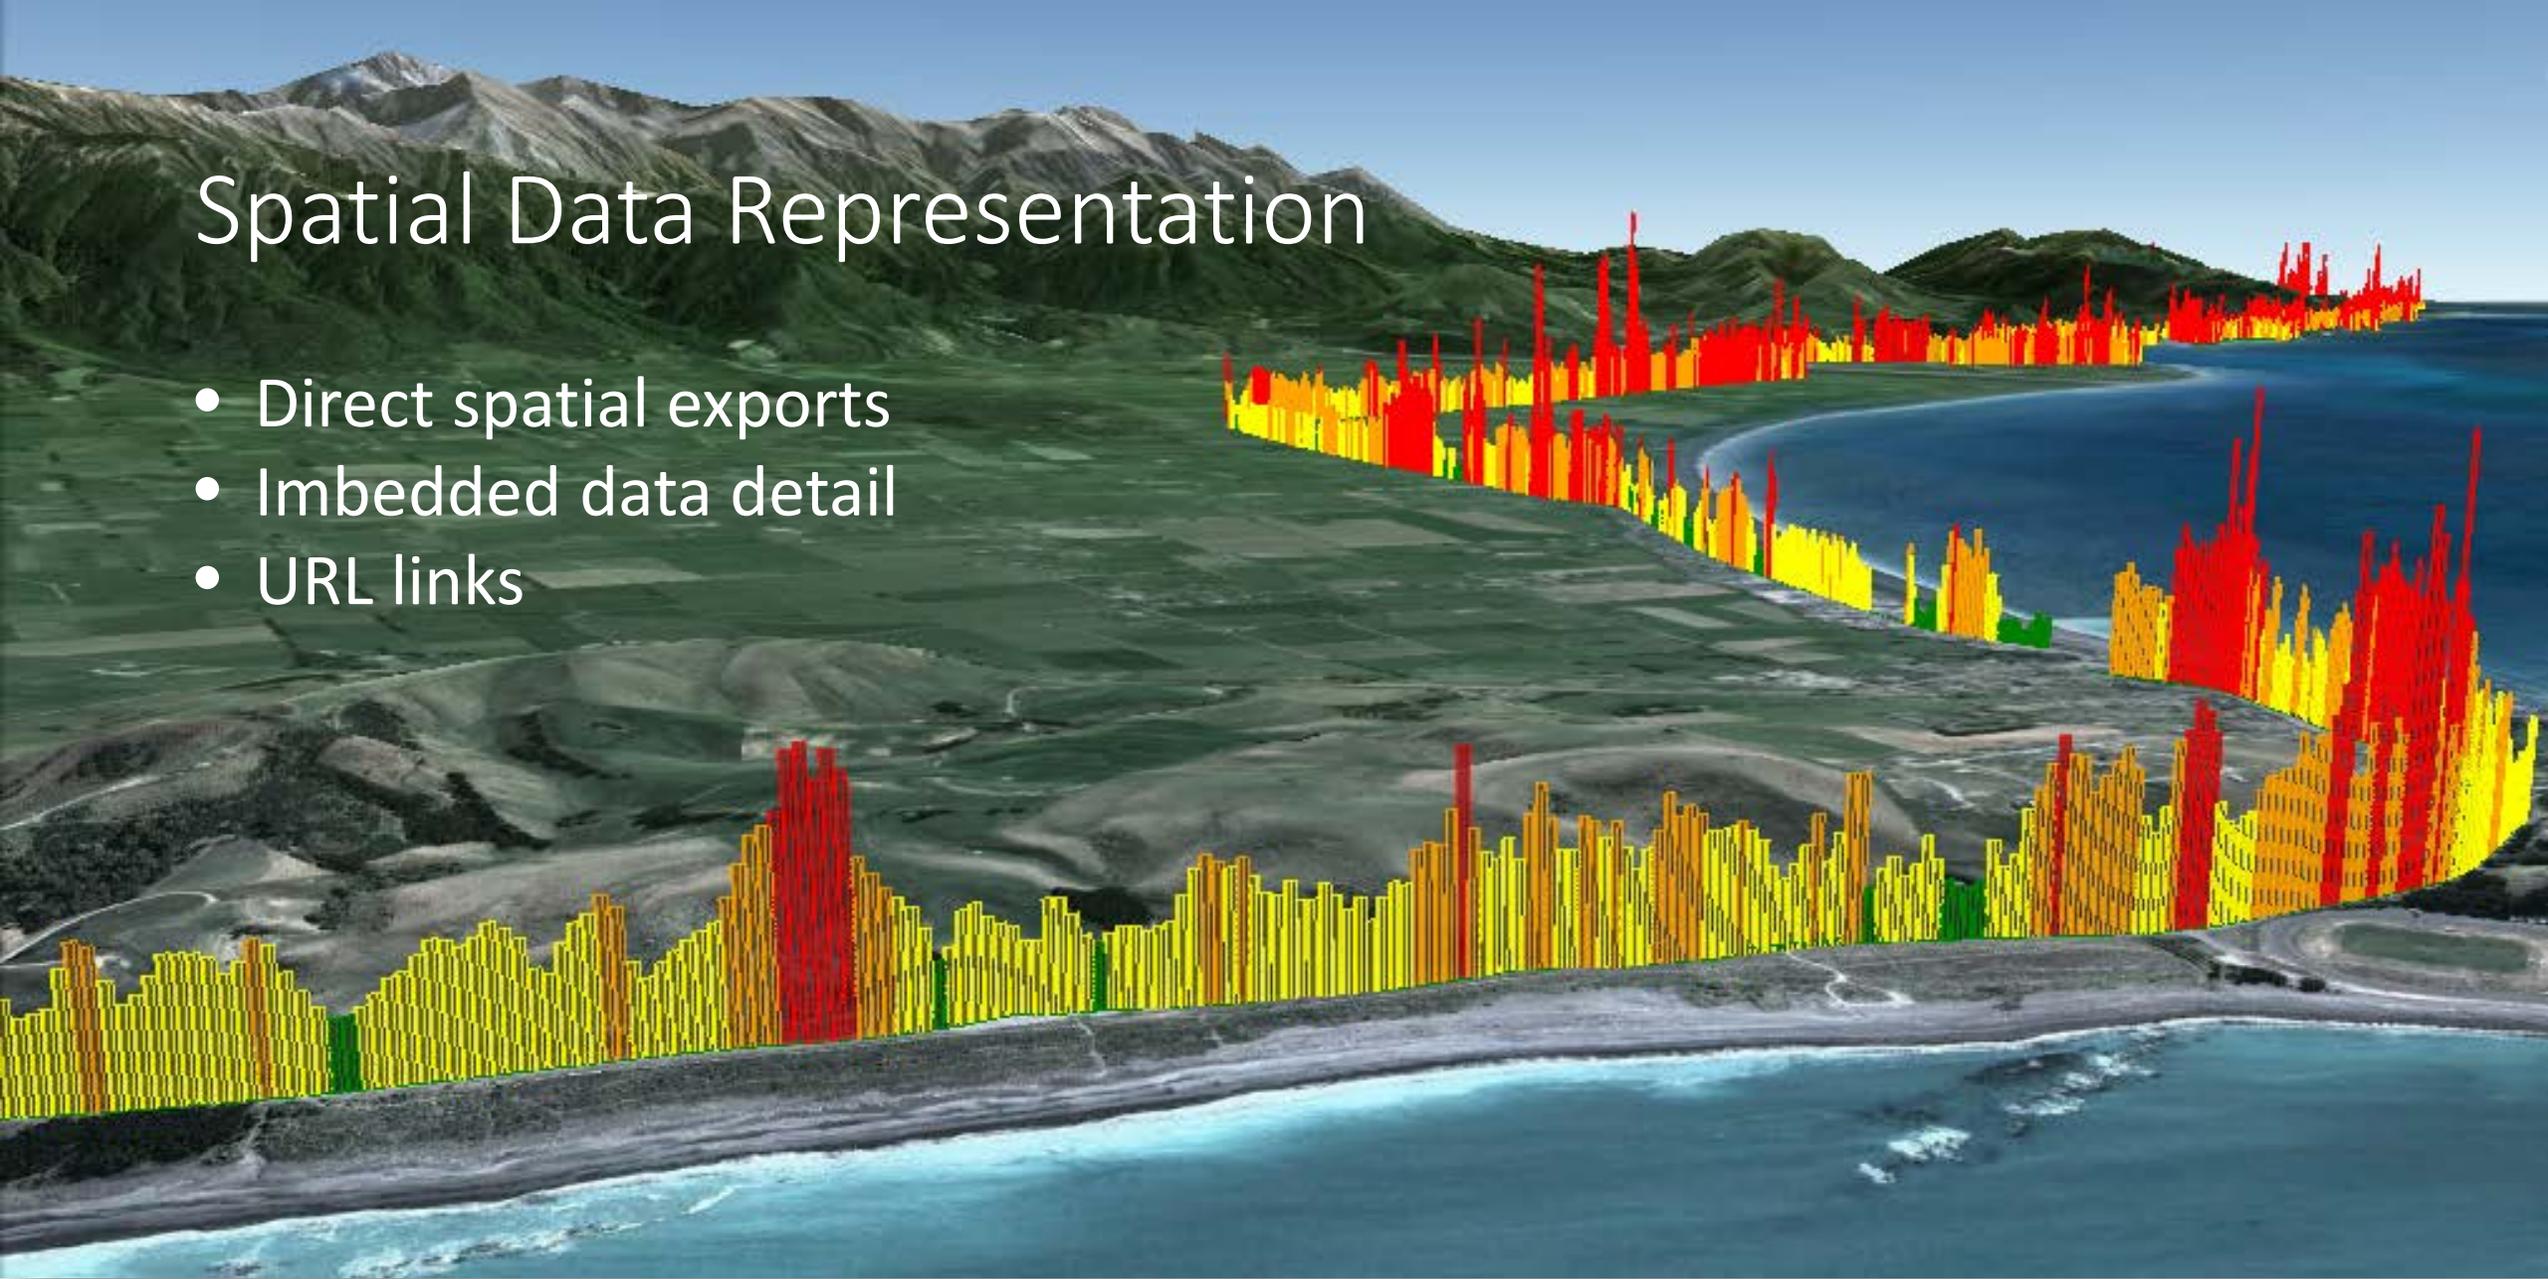

## Averages over network level segments

- Lose something in the summation.

# Spatial Data Representation

- Direct spatial exports
- Imbedded data detail
- URL links

# All data in one place...for all time

9 years ago in 2009

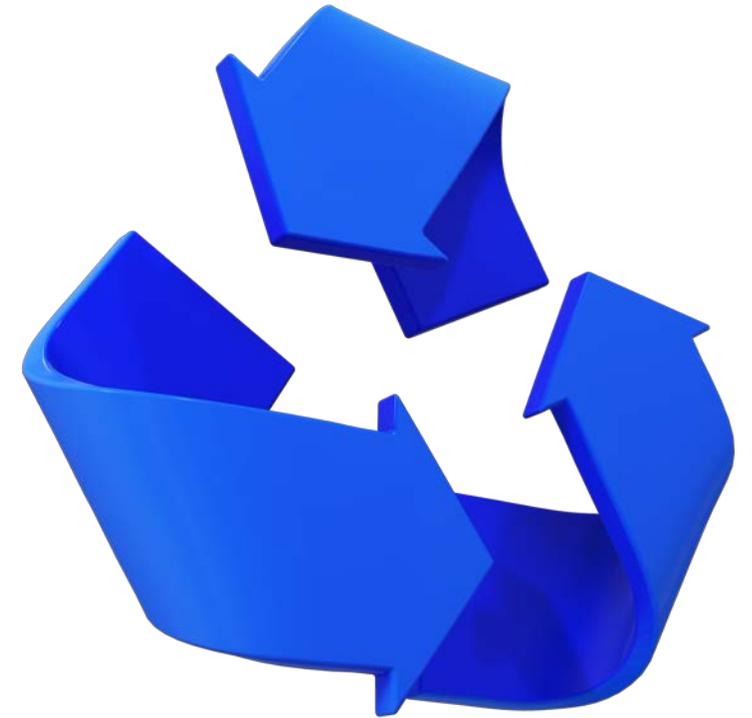

4 years ago in 2014

# Preliminary Conclusions

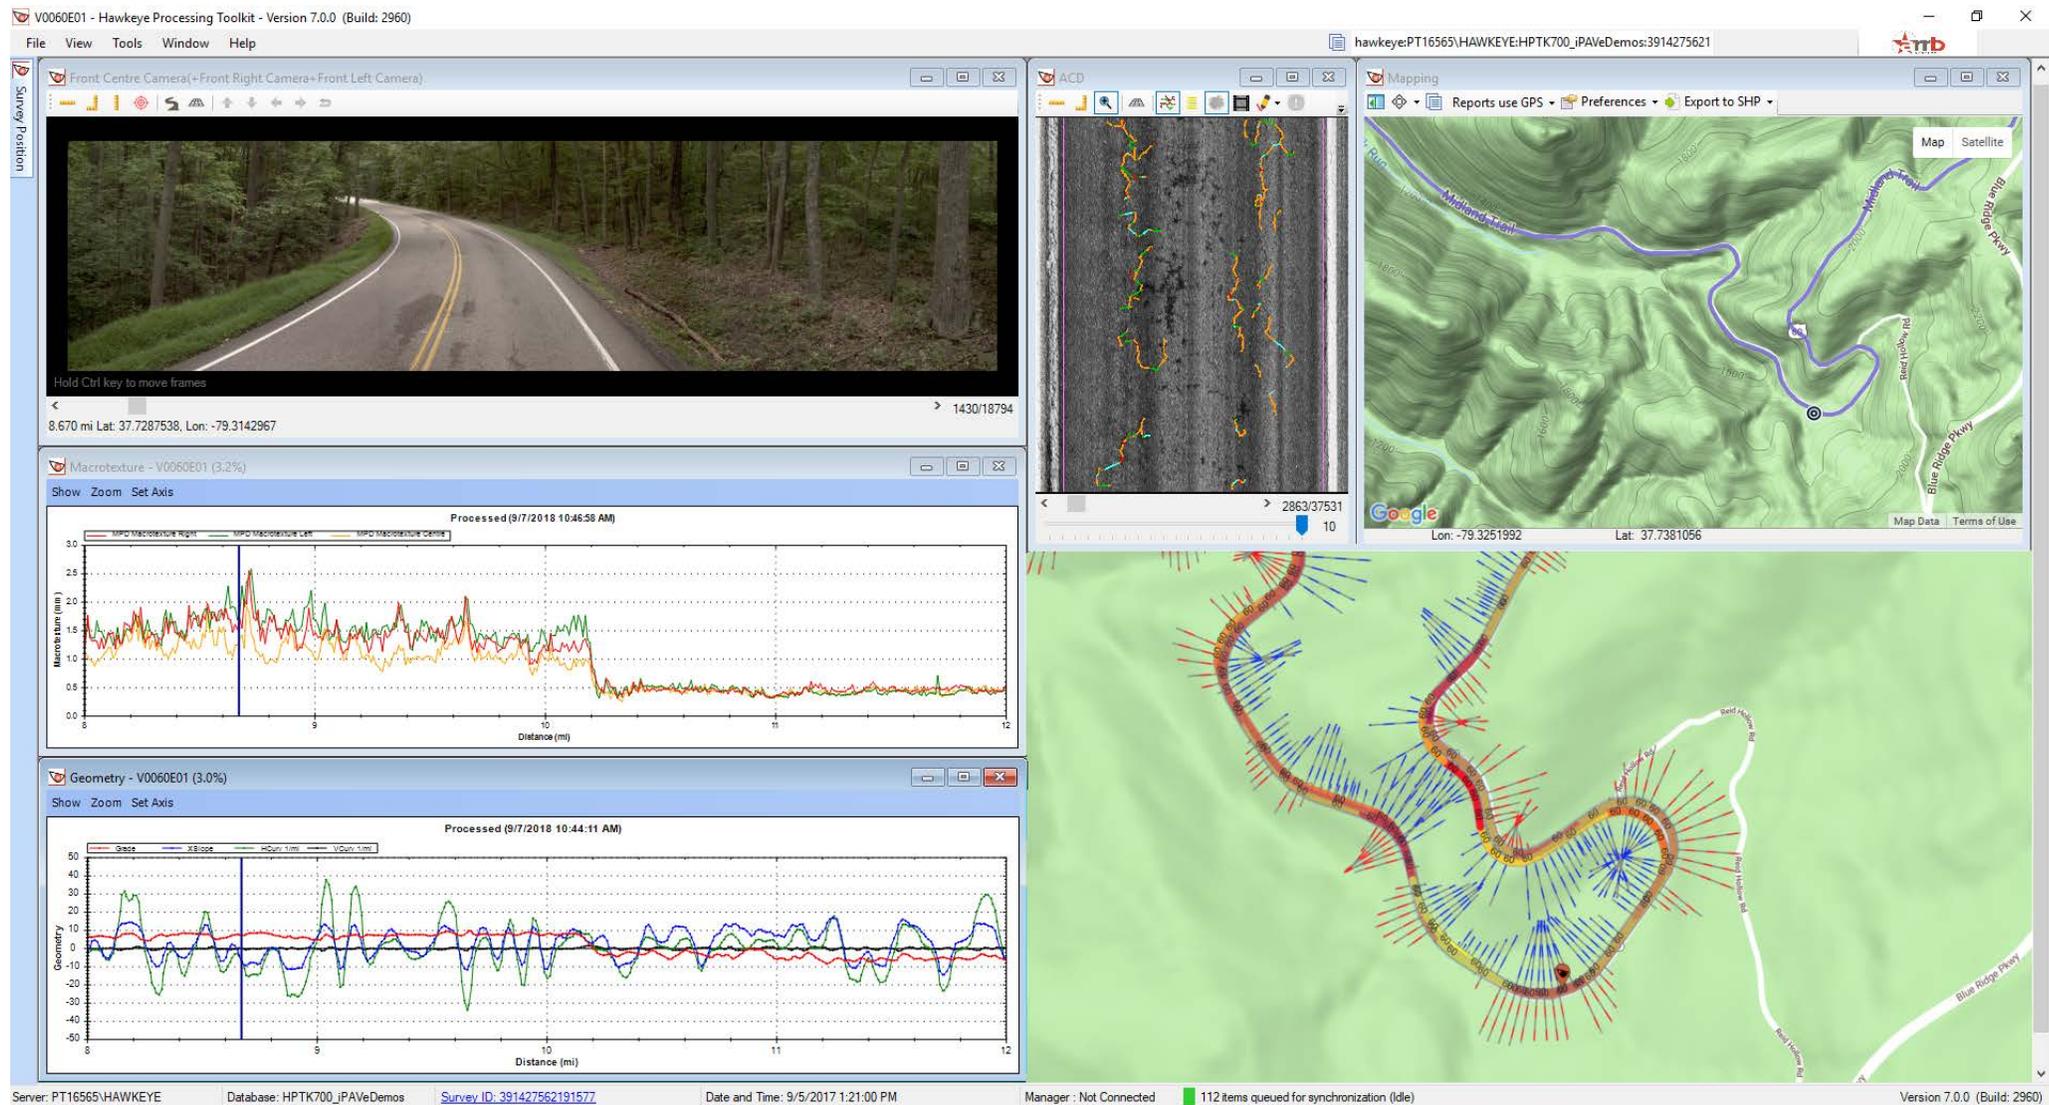

Measuring friction continuously,  
especially when complemented by:

- + road geometry
- + imagery
- + texture
- + rutting
- + traffic
- + crash data

- ✓ Provides a more effective method for identifying the most critical sections
- ✓ Allow for focused safety improvement efforts on higher risk locations, such as:
  - intersections and
  - curves.

# Comprehensive Assessment

# Questions

- How can network level pavement evaluation better support safety assessments decisions?
- What are the perceived limitations and/or potential approaches for mitigation?
- What additional applications for these new tools merit consideration?
